

GTECH NEW-HIRE ONBOARDING

Day One

with Ali Muthu Ah Hock

Day One sends each access request for a new hire to IT, in the correct order, and shows the new hire the one step that is their turn.

A new hire waits 12 to 20 working days before they have all access

Ali
THE PROBLEM

1 · Account
Google Workspace email, then the new hire sets a password

→

2 · HR and help desk
GEMS (SAP SuccessFactors), GES (HR information system), GSD (Gamuda Service Desk)

→

3 · Work tools
Slack, Atlassian (Jira and Confluence), Bitbucket

→

4 · Project
GCP (Google Cloud) through Slack, and the repo

Up to 11 requests. Each waits for the one before it. 4 hand-offs × 3–5 days each. (estimate from GT staff)

Nobody owns the chain
A person must remember to raise each next request, in the correct channel.

Nobody sees the hold-up
No system shows where the new hire is stuck, or why.

The wait is empty
The new hire does not know what GTech builds, or whom to ask.

OUR ANSWER

One form. Day One does the chain.

Muthu

HOW DAY ONE HELPS

1

The buddy fills in one form

The plan changes with the hire: 11 steps for a staff developer, 5 for an intern non-developer.

2

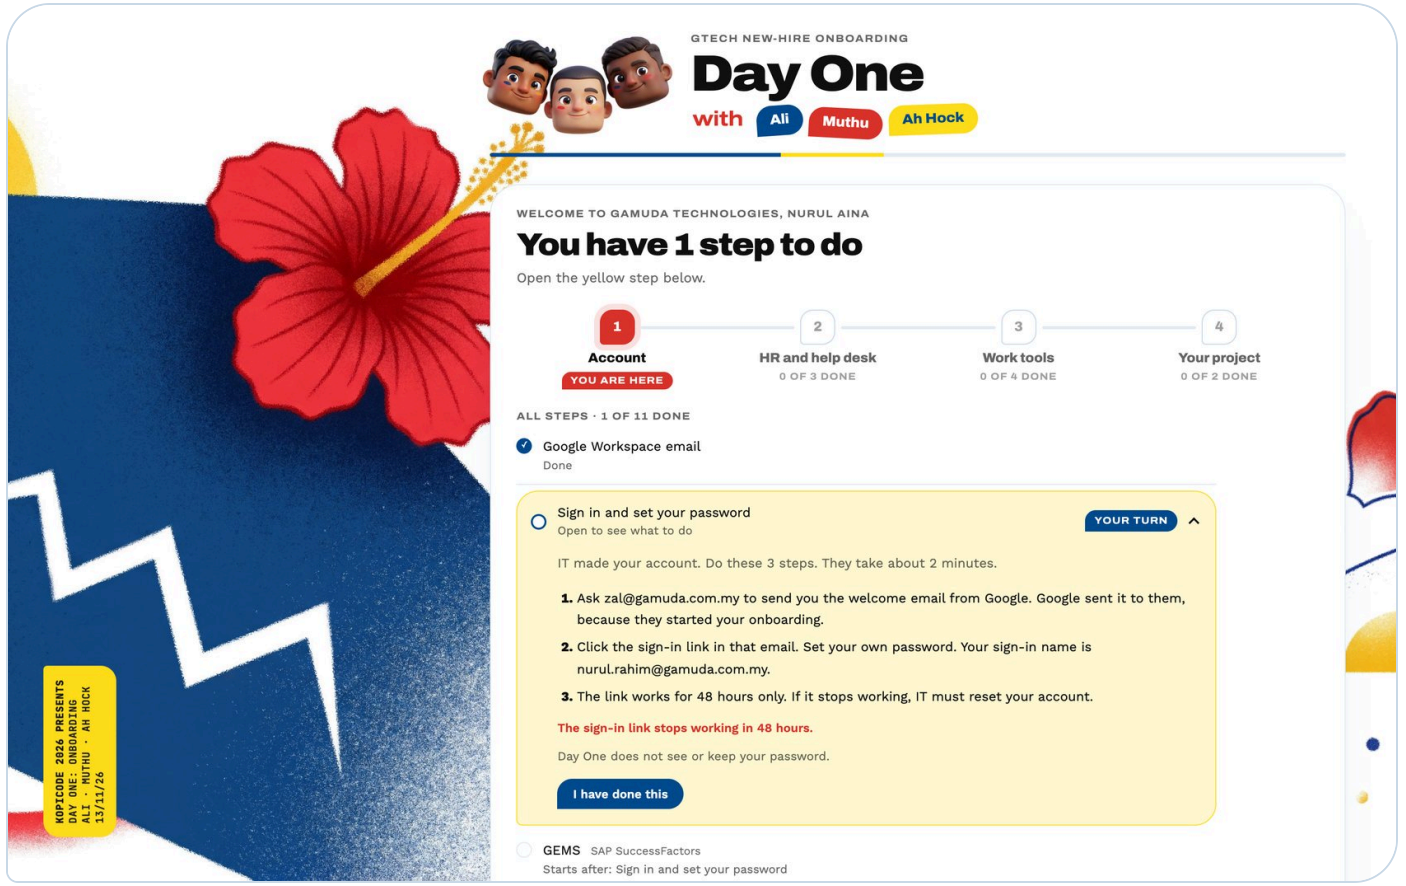

Day One sends each request in order

It raises the GSD tickets, checks their status, and sends each next request by itself.

3

The new hire sees one yellow step

Their own page, with no password. While IT works, they learn about GTech.

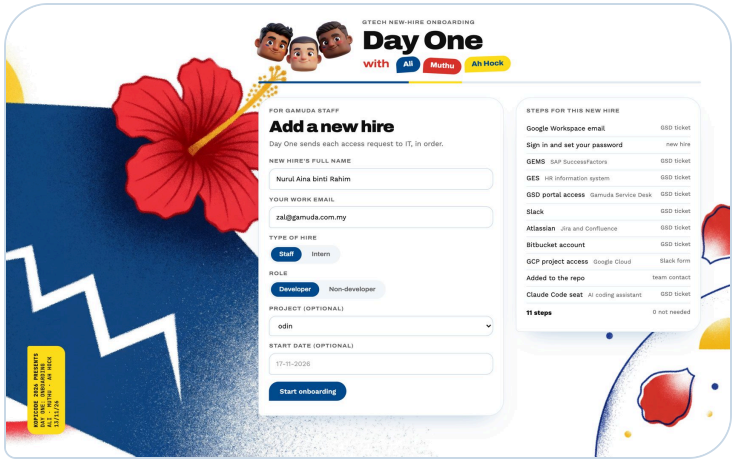

THE FLOW

One form to “You are ready”

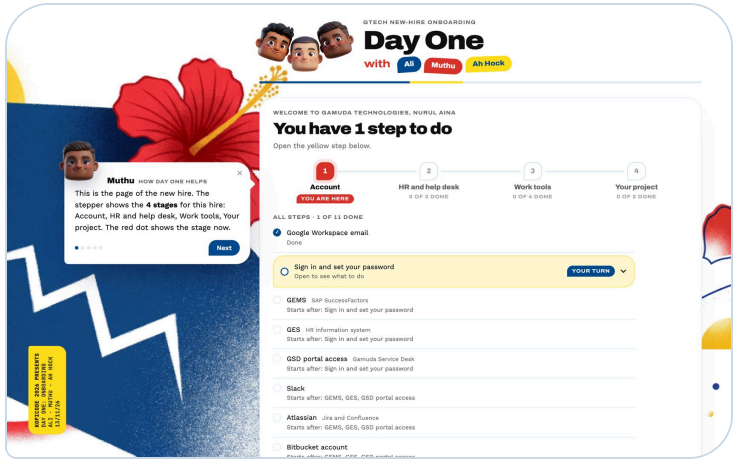

Muthu

HOW DAY ONE HELPS

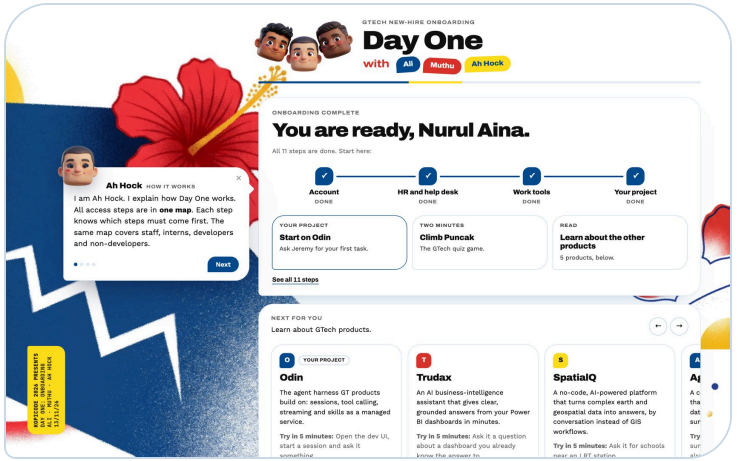

Add a new hire

The plan on the right shows every step for this hire, and the steps it does not need.

The new hire's page

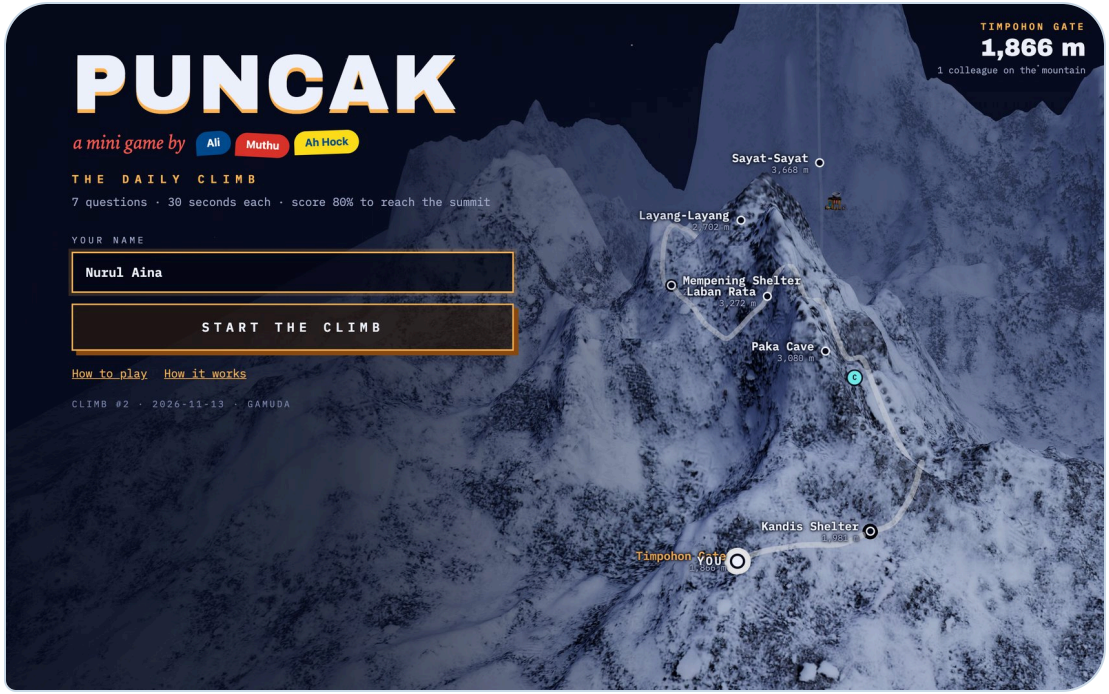

A stepper with “You are here”. The guide explains each part. Stages finish in order.

You are ready

All access is done. Next: the project, the quiz, and the other products.

Puncak: climb the mountain, learn GTech

A quiz game about Gamuda

Seven questions a day. Each right answer moves the player higher up a 3D mountain. 80% of the maximum score reaches the summit.

Fair to type answers

Typed answers, with “did you mean” for small typing errors. Some questions score by rarity: common, rare, very rare.

Part of the wait

The new hire opens Puncak from their Day One page, with their name filled in. The product cards beside it show each product and its contact person.

One map of steps. Four channels.

Ah Hock
HOW IT WORKS

Two rules decide the plan

Type of hire (staff or intern) × role (developer or not). The project adds the repo and GCP.

Staff developer	**11 steps**
Intern developer	**8 steps**
Staff non-developer	**8 steps**
Intern non-developer	**5 steps**

Each step uses the correct channel

GSD ticket	Day One raises it and reads its status
Slack form	GCP: Day One fills in the /gcp-request values
New hire	Set the password, sign in to GES
Team contact	Adds the new hire to the repo. Day One writes the message

Each stage starts only when the stage before it is done, so nothing finishes ahead of the new hire.

TECHNOLOGY

Built on the same API as GSD

Ah Hock
HOW IT WORKS

Browser
One page, plain HTML and JavaScript. The guide (Ali, Muthu, Ah Hock) reacts to events in the app.

→

Day One server
Python FastAPI. The step engine keeps the map, the stages and the state of each hire in SQLite. Puncak runs on the same server.

→

Freshservice API /api/v2
GSD runs on Freshservice. Day One creates and reads tickets through its API.

Demo: a local copy of that API

A GSD user account cannot get an API key. One setting connects Day One to the real GSD.

Hosted on Render

The demo you see runs at day-one-brst.onrender.com. Contact names in the demo are examples. Product links are real.

IT reply, read by Day One

When IT closes the email ticket, Day One reads the new address from the reply and sends the next requests.

NEXT

- Connect Day One to the real GSD with an agent API key.
- Create the Google account through the Google Admin API, so the sign-in link goes to the new hire directly.
- Add more products and more Puncak questions.

From day one, every new hire knows the next step.

Thank you.
